

Let a client in. Then limit what it may do.

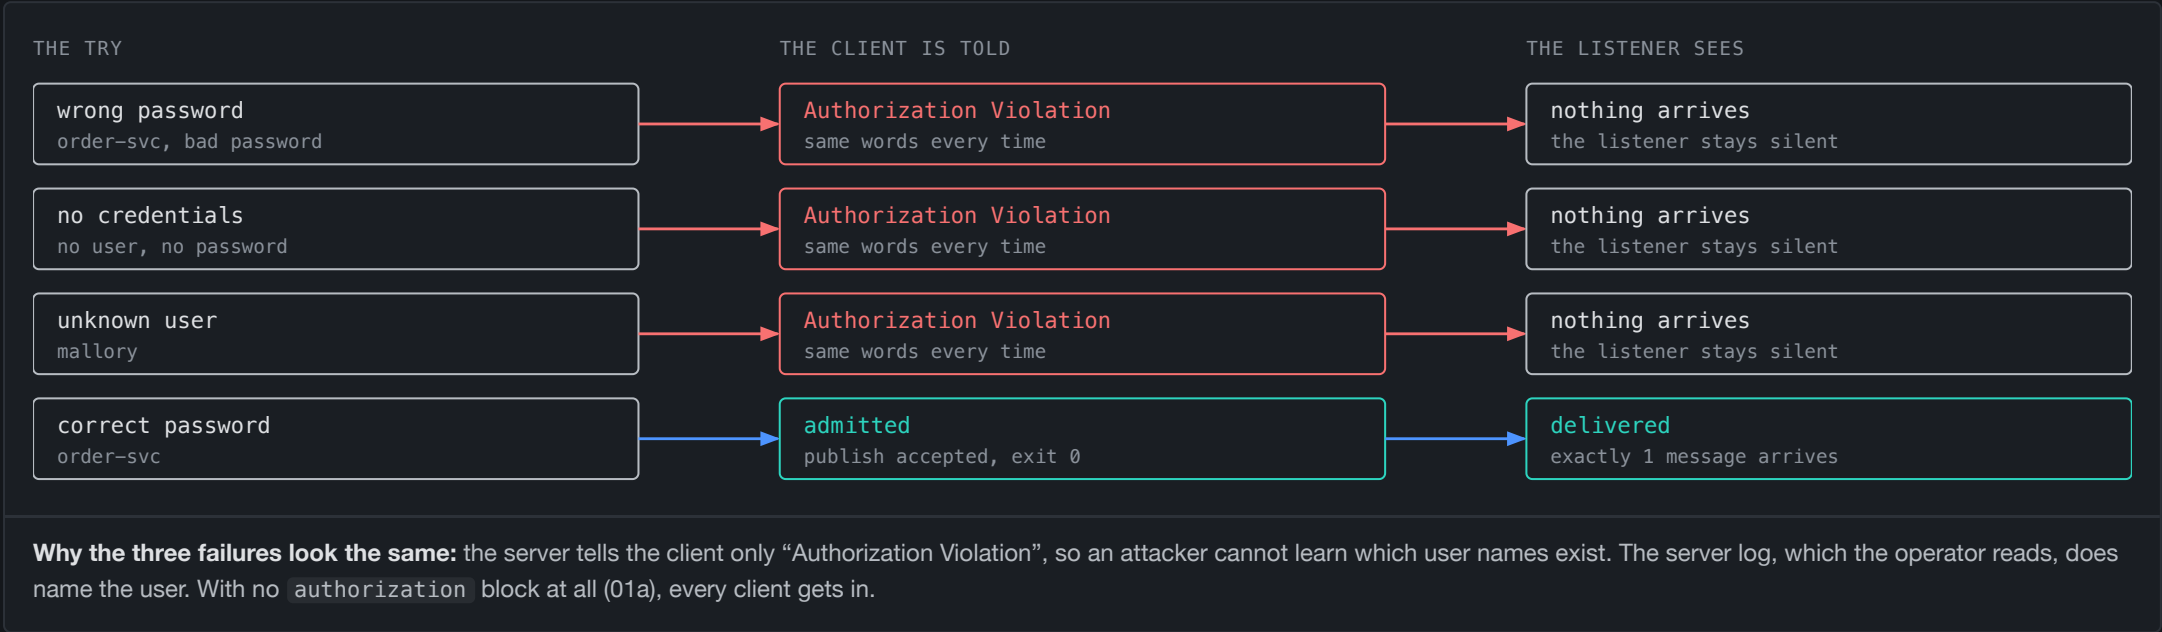

The question: can we admit a client while limiting exactly what it may publish and subscribe to?

Two NATS users, `order-svc` (writes orders) and `analytics-reader` (reads them), on one bare server. Everything below was run in a terminal and re-run as a check script.

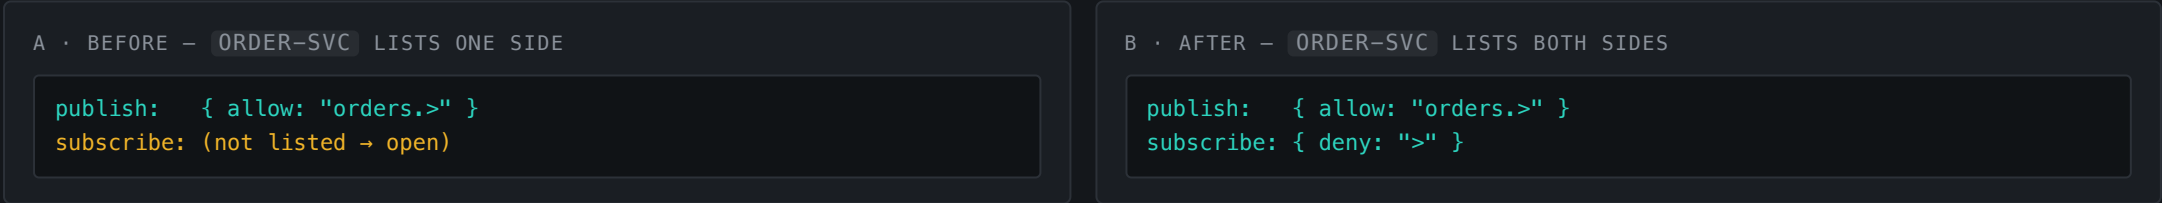

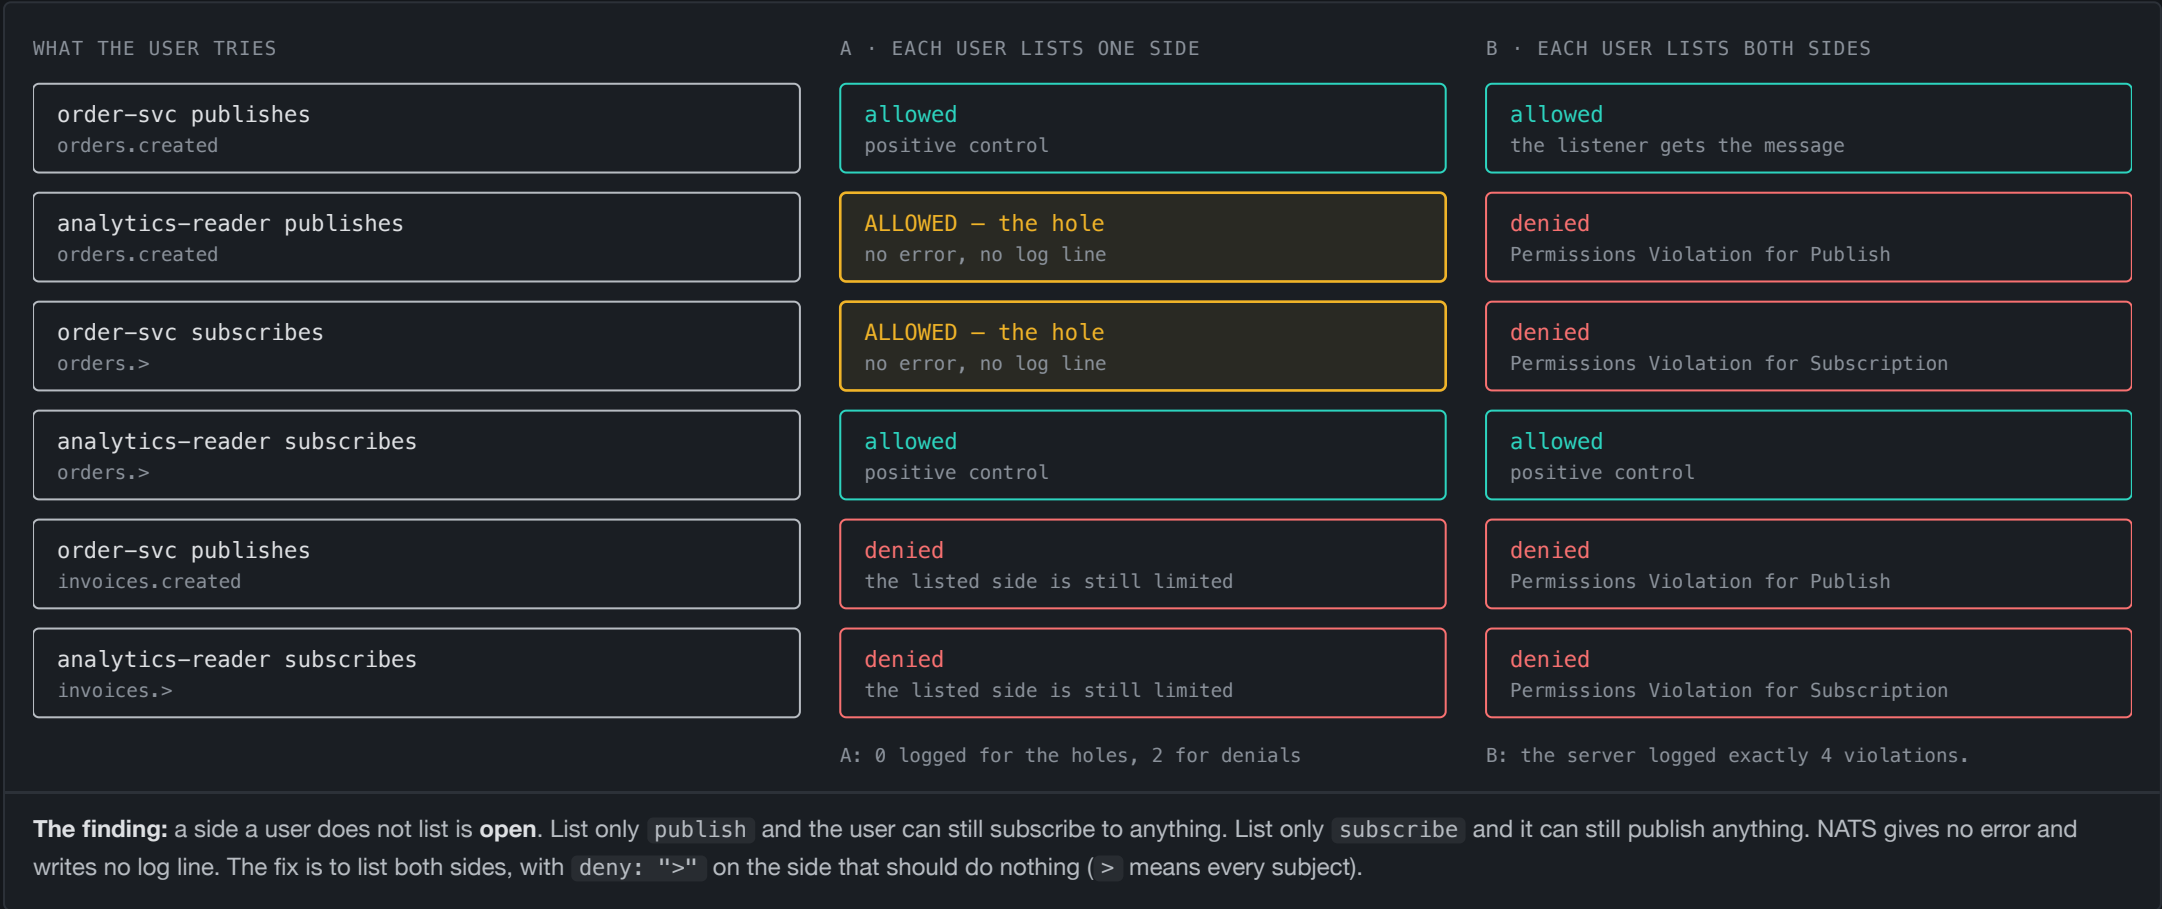

00 Two ideas. Keep them apart.

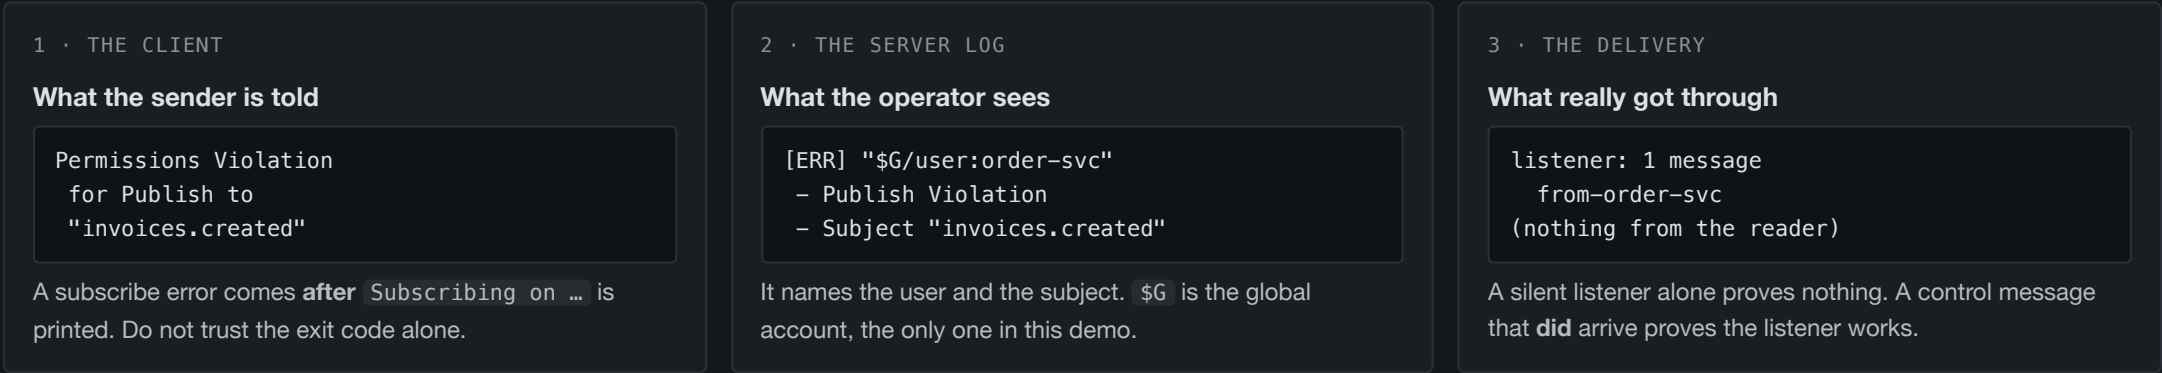

01 Exercise 01 — who gets in?

02 Exercise 02 — the open side

03 Read a denial in three places

04 How sure are we?

16

checks in `ex01-check.sh` , all pass

24

checks in `ex02-check.sh` , all pass

3

runs of each script, same result

0

servers left running; port 4522 proven free
